(CHAPTER 8)  
Method of Revolution
Theory

As much as an observer can move around to take a proper position to see the side of the product, the product can be rotated for an observer at a position.
It can be used as much as the method of auxiliary view can in order to find necessary geometric information. Below is shown how to find TL.
Two views are all given and one has to find the edge view.
TS of a Plane

Auxiliary view can be used along with revolved views.
